

Zipline - File Sharing

What is Zipline?

Zipline is a self hosted sharing beast. It allows you to upload files to it (including videos, images, and others) and share them with a URL. The URL has metadata that works with most common messaging platforms allows for the content to be viewed directly in said platform. So far I have been able to confirm this working on Discord (what Zipline has focused on the most) and iMessage / Apple Messages (using specific video conversion methods).

Documentation

With Zipline, its stupid simple to download and share memes and other content. For the most part its used to quickly upload files to then share with others. But my use case is more of a meme storage vessel.

The only issue I have with Zipline is that I can't just give it a URL, and have it download the content from it, and save it. This is where the project gets interesting.
